Languages: Spanish, Brazilian Portuguese, English

Front-End Developer at Depsys Informática: Within the *Depsys Informatica* company, I work on the *LiberaSOFT* project, which provides a management system for all business processes quickly and securely. Mobile apps are included, which allow for the optimization of response times within a company. These apps are modular, with the possibility of acquiring modules as needs arise, and an integrated e-commerce store with *B2C*, *B2B*, and *Mercado* Libre I collaborate with my team on the client side using the *PrimeNg* library, *Angular*, and its workspace packages. Together with my team, we implement lazy loading and modularization in the project. On my part, I refactored template-driven form components, migrating them to reactive forms in different modules of the application. I customized methods that allow for printing *PrimeNg* tables in *Excel* and *PDF* formats, as well as methods to load all the necessary endpoint data for each component Currently, I'm implementing improvements and solutions to the various problems that arise in different modules during application development. We use the MantisBT software to effectively manage tasks with my team

Freelance Web Developer at La Estamos Rompiendo: I developed an application using *HTML*, *CSS*, and *JavaScript* for the Appointment Setters team at *La Estamos Rompiendo*. I provided employees with a simple and efficient way to manage the tracking of various important data in their daily work. Employees will be able to input and track crucial information (Follow-ups, inbound leads, outbound leads, calls proposed, new bookings, etc.). The platform includes a function that allows them to download the data locally in txt format. The application was a customized solution that improved efficiency and accuracy in tracking key data for the appointment setters team

Freelance Web Developer at Make It Happen Ministry: I worked collaboratively with a design and marketing team to develop a platform for an international Christian ministry. I used *Angular* for platform development and set up *Firebase* hosting with *Hostinger*. I created a form for users to anonymously send their messages to contact professional counselors. I connected the ministry's official radio so that users can listen to real-time broadcasts
